

Chubb protects Hong Kong residential landmark from fires

Sorrento, centrally located above the Kowloon MTR Station, is one of the Hong Kong's highest residential apartment tower complexes at 65 storeys tall

In 2003 Chubb successfully installed the fire services system to protect the five 51-65 storey high apartment towers that also included six levels of podium car-parking and a club house.

The fire service installation comprises:

- Addressable fire alarm system
- Audio/visual advisory system
- Fire hydrant and hose reel system
- Sprinkler system
- Drencher system
- Fire shutters
- Portable fire extinguishers

Chubb's success in installing fire safety systems for such large projects has been a result of using Achieving Competitive Excellence (ACE) tools - our business operating system that helps standardize processes, reduce turnbacks and improve the efficiency and quality of our work.

With ACE, Chubb's engineering team has consistently met stringent quality requirements, budget and timing pressures.
